

Alexander Winkles Computer Project #3
09/28/2016

Here is a copy of my code:

```
type newtondivdiff.m

function p = newtondivdiff(xx,yy,q1,q2,q3)
%p(x) = newtondivdiff(xx,yy,h)
%
%This is an algorithm developed by Alexander Winkles that takes data and
%utilizes divided differences to generate the Newton interpolating
%polynomial of the given data.
%
%The output p(x) may be used for evaluation the polynomial in various ways.
%
%xx : the nodes
%yy : the results
%q1 : prints divided difference table if q1 == 1
%q2 : prints the interpolated polynomial if q2 == 1
%q3 : prints figures to compare data to interpolating polynomial if q3 == 1

format rat

%Builds a matrix of the divided difference values, including f(x_i)
%values.

l = length(xx);

t = zeros(l,l);

t(:,1) = yy';

for j = 2 : l
    for i = 1 : (l - j + 1)
        t(i,j) = (t(i+1,j-1) - t(i,j-1))./(xx(i+j-1) - xx(i));
    end;
end;

%Uses values from the first row of the divided difference table to
%generate the Newton interpolating polynomial.

q = @(x) 0;
v = @(x) 1;

for j = 1 : l
    if j == 1;
        q = @(x) t(1,j);
    else
        u = t(1,j);
        v = @(x) v(x).*(x - xx(j-1));
        q = @(x) q(x) + u.*v(x);
    end;
end;
```

```
    end;
end;

%Generates the same polynomial as above for printing purposes. (find out
%how to remove

b = 0;
a = 1;

for j = 1 : l
    if j == 1;
        b = t(1,j);
    else
        syms x;
        u = t(1,j);
        a = a*(x - xx(j-1));
        b = b + u*a;
    end;
end;

%Print results.

if q1 == 1
    fprintf('\nThe divided difference table is as follows:\n\n')
    disp(t)
end;

if q2 == 1
    fprintf('\nThe Newton interpolating polynomial is:\n\n %s\n\nUse the following to further evaluate
end;

p = @(x) q(x);

%Plots points and the interpolating polynomial.

if q3 == 1
    figure('Name','Data points')
    scatter(xx,yy);

    figure('Name','Data points on polynomial')
    %sorted = sort(xx);
    %ss = sorted(2) : 0.01: sorted(length(sorted)-1);
    rr = min(xx) : 0.1: max(xx);
    %plot(ss,q(ss));
    plot(rr,q(rr));
    hold on
    plot(xx,yy,'+')
    hold off

    figure('Name','Interpolating polynomial over a large domain')
    domain = 0 : 1 : 500;
    range = q(domain);
    plot(domain,range)
    hold on
```

```

    plot(xx,yy,'+')
    hold off
end;

```

Problem 1:

Here are the data points given from the problem, with 0 being defined as 1958.
Likewise, we made y values integers, so 5 cents is 5.

```
xx = [5 10 13 16 20 23.25 23.75 27 30 33 37 41 43];
```

```
yy = [5 6 8 10 15 18 20 22 25 29 32 33 34];
```

Now we call the function to obtain a interpolating polynomial to work with.

```
z = newtondivdiff(xx,yy,0,0,1)
```

```
z =
```

```
@(x)q(x)
```

To find when $P(x) = 100$ (\$1), we define a new polynomial 'poly' that we may apply the bisection method to.

```
poly =@(x) z(x) - 100
```

```
poly =
```

```
@(x)z(x)-100
```

```
bisec(poly,20,50,1e-5,100,1)
```

| Step | Result |
|------|-----------|
| --- | ----- |
| 0 | 35.000000 |
| 1 | 42.500000 |
| 2 | 46.250000 |
| 3 | 44.375000 |
| 4 | 43.437500 |
| 5 | 42.968750 |
| 6 | 43.203125 |
| 7 | 43.085938 |
| 8 | 43.144531 |
| 9 | 43.115234 |
| 10 | 43.100586 |
| 11 | 43.107910 |
| 12 | 43.111572 |
| 13 | 43.113403 |
| 14 | 43.114319 |
| 15 | 43.114777 |
| 16 | 43.115005 |
| 17 | 43.114891 |

| | |
|----|-----------|
| 18 | 43.114834 |
| 19 | 43.114805 |
| 20 | 43.114820 |
| 21 | 43.114827 |
| 22 | 43.114830 |
| 23 | 43.114828 |
| 24 | 43.114828 |
| 25 | 43.114828 |
| 26 | 43.114828 |
| 27 | 43.114828 |
| 28 | 43.114828 |
| 29 | 43.114828 |

The solution is 4.311483e+01. The computation was a success after 29 iterations!

```
poly(43.114828)
```

```
ans =
```

```
-1.681689791439567e-04
```

Now we do the same for $P(x) = 10000$ (\$100).

```
poly=@(x) z(x) - 10000
```

```
poly =
```

```
@(x)z(x)-10000
```

```
bisec(poly,20,5000,1e-5,100,1)
```

| Step | Result |
|------|-------------|
| --- | ----- |
| 0 | 2510.000000 |
| 1 | 1265.000000 |
| 2 | 642.500000 |
| 3 | 331.250000 |
| 4 | 175.625000 |

31          45.354746
32          45.354746
33          45.354746
34          45.354746
35          45.354746
36          45.354746
37          45.354746

```

The solution is 4.535475e+01. The computation was a success after 37 iterations!

```
poly(45.354746)
```

```
ans =
```

```
5.902188568143174e-04
```

Unfortunately, these results do not make sense with the given data. It is thus concluded that Newton interpolation fails outside of the domain of given points.

```
-----
Problem 2:
-----
```

Now we will test several functions with various n's to obtain their divided difference tables.

```
f=@(x) x.^2 + 2
```

```
f =
```

```
@(x)x.^2+2
```

```
x = -4 : 1 : 4;
```

```
y = f(x);
```

```
newtondivdiff(x,y,1,0,0)
```

The divided difference table is as follows:

Columns 1 through 8

| | | | | | | |
|----|----|---|---|---|---|---|
| 18 | -7 | 1 | 0 | 0 | 0 | 0 |
| 11 | -5 | 1 | 0 | 0 | 0 | 0 |
| 6 | -3 | 1 | 0 | 0 | 0 | 0 |

| | | | | | | |

| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 |

ans =

@(x)q(x)

x = -3 : 1 : 3;

y = g(x);

newtondivdiff(x,y,1,0,0)

The divided difference table is as follows:

| | | | | | | |
|-----|----|----|---|---|---|---|
| -34 | 19 | -6 | 1 | 0 | 0 | 0 |
| -15 | 7 | -3 | 1 | 0 | 0 | 0 |
| -8 | 1 | 0 | 1 | 0 | 0 | 0 |
| -7 | 1 | 3 | 1 | 0 | 0 | 0 |
| -6 | 7 | 6 | 0 | 0 | 0 | 0 |
| 1 | 19 | 0 | 0 | 0 | 0 | 0 |
| 20 | 0 | 0 | 0 | 0 | 0 | 0 |

ans =

@(x)q(x)

h=@(x) sin(x)

h =

@(x)sin(x)

x = -3 : 1 : 3;

y = h(x);

newtondivdiff(x,y,1,0,0)

The divided difference table is as follows:

| | | | | | | |
|------------|-----------|----------|-----------|-----------|-----------|---|
| -441/3125 | -729/949 | 887/2122 | -60/5773 | -151/5095 | 127/21426 | 0 |
| -401/441 | 347/5116 | 364/941 | -409/3172 | 0 | 127/21426 | 0 |
| -1327/1577 | 1327/1577 | 0 | -409/3172 | 151/5095 | 0 | 0 |
| 0 | 1327/1577 | -364/941 | -60/5773 | 0 | 0 | 0 |

| | | | | | | |
|-----------|----------|-----------|---|---|---|---|
| 1327/1577 | 347/5116 | -887/2122 | 0 | 0 | 0 | 0 |
| 401/441 | -729/949 | 0 | 0 | 0 | 0 | 0 |
| 441/3125 | 0 | 0 | 0 | 0 | 0 | 0 |

ans =

@(x)q(x)

Problem 3:

We define the function as follows:

f = @(x) 1./(1+25*x.^2)

f =

@(x)1./(1+25*x.^2)

First we test n = 5:

```
x = -1 : 0.5 : 1;
y = f(x);
newtondivdiff(x,y,1,0,1)
```

The divided difference table is as follows:

| | | | | |
|------|---------|---------|-----------|----------|
| 1/26 | 75/377 | 575/377 | -1250/377 | 1250/377 |
| 4/29 | 50/29 | -100/29 | 1250/377 | 0 |
| 1 | -50/29 | 575/377 | 0 | 0 |
| 4/29 | -75/377 | 0 | 0 | 0 |
| 1/26 | 0 | 0 | 0 | 0 |

ans =

@(x)q(x)

Now we test n = 10:

```
x = -1 : 0.25 : 1;
y = f(x);
newtondivdiff(x,y,0,0,1)
```

ans =

@(x)q(x)

Finally, we test n = 15:

```
x = -1 : 0.1 : 1;
y = f(x);
```

```
newtondivdiff(x,y,0,0,1)
```

```
ans =
```

```
@(x)q(x)
```

Now we produce a graph of the function for comparison. All graphs may be found in order after this log.

```
domain = [-1 1];
```

```
fplot(f,domain)
```

```
diary off
```

Figure 1: Polynomial interpolation when $n = 5$ 

Figure 2: Polynomial interpolation when $n = 10$ 

Figure 3: Polynomial interpolation when $n = 15$ 

Figure 4: The graph of $f(x)$
